Family by family: what the new Construction Products Regulation asks of Turkish building-material exporters

Regulation (EU) 2024/3110 has applied since 8 January 2026. It moves product families across one at a time and adds environmental data to the declaration.

Ahmed Furkan Gul, Founder, Ganrich Advisory

October 2026

Executive summary

1. The new EU Construction Products Regulation, Regulation (EU) 2024/3110, entered into force on 7 January 2025 and its main provisions have applied since 8 January 2026. It replaces Regulation (EU) No 305/2011, but not overnight: each product family moves to the new rules when the Commission cites new harmonised technical specifications for it.
2. For a Turkish exporter of ceramics, cement, glass, insulation, steel products or façade systems, the practical change is in the declaration. The declaration of performance and the declaration of conformity are combined, environmental characteristics based on life-cycle assessment are added step by step, and a digital product passport is planned to carry the information.
3. The sound question is not whether the Regulation applies to us, but when each of our product families switches, what environmental data its technical specification will require, and whether we can produce that data without rebuilding our files twice.

What has changed

Regulation (EU) 2024/3110 was adopted in November 2024. It entered into force on 7 January 2025 and its main part has applied since 8 January 2026. Being a regulation, it applies directly in every EU member state.

The two regimes coexist. While a product is covered by a harmonised standard cited under the 2011 Regulation, that framework continues to apply. Once a new harmonised technical specification for the product family is cited under the new Regulation, a coexistence period of at least one year follows, after which the product must meet the new rules. The European Commission says the old framework ends completely in 2039, and aims to replace the old standards well before then.

Manufacturers will declare environmental characteristics based on life-cycle assessment, as set out in Annex II and in each technical specification. Global warming potential is the first characteristic most families are expected to report. A new assessment system, System 3+, covers verification of environmental characteristics.

The Regulation also creates a digital product passport for construction products. It is meant to carry the declaration of performance and conformity and other required documents in machine-readable form. Its detailed rules come through later implementing acts, so the passport is not yet a day-to-day requirement.

Obligations reach beyond the manufacturer. Importers, distributors and online marketplaces have defined duties, and notified bodies must meet stricter requirements by 8 January 2030.

Türkiye aligns its construction products legislation with EU rules under the Customs Union. For the home market, follow the national texts of the Ministry of Environment, Urbanisation and Climate Change.

The decision behind the requirement

The Regulation turns environmental performance from a marketing claim into a declared characteristic. For many Turkish producers the cost lies less in the declaration itself than in the data behind it: energy and fuel use by line, raw material sources, transport and production yield, measured consistently enough to survive verification.

Because families switch at different times, the work can be sequenced. A producer that knows which families switch first, which EU customers already ask for environmental product declarations, and which plants have the data can build one data routine and reuse it, rather than commissioning separate studies for each request.

There is also a commercial side. EU contractors and public buyers increasingly compare products on embodied carbon. A declared, verified figure can win a tender; a missing one can lose it, even before the rule formally applies to the family.

Five common misreadings

“The new Regulation applied to everything from 8 January 2026.” It applies family by family, as new technical specifications are cited. Many products are still placed on the market under the 2011 framework.

“Our existing EPD covers the environmental declaration.” It may help, but the declared values must follow the method and characteristics in the technical specification for the family, and may need third-party verification.

“The digital product passport is due now.” The legal basis exists, but the detailed requirements come through later implementing acts.

“Our EU importer handles compliance.” The manufacturer remains responsible for the declaration. Importers and distributors must check it, and they increasingly ask for the evidence.

“Only the CE marking changes.” The combined declaration, environmental data and new product requirements change the work behind the marking, not just the label.

Questions for the leadership team

1. Which of our product families are sold into the EU, and which harmonised standard covers each of them today?
2. Has a new harmonised technical specification been cited, or is one expected, for any of them?
3. Which EU customers already ask for environmental product declarations or embodied-carbon figures?
4. Do we have plant-level data on energy, fuels, raw materials and yield that could support a life-cycle assessment?
5. Who owns the declaration of performance today, and who will own the combined declaration?
6. Which notified bodies do we rely on, and are they preparing for the new requirements?
7. How will we supply information digitally when the product passport arrives?
8. Which contracts and tender documents refer to the 2011 Regulation?

What a good first step produces

A useful first step is a family-by-family map: each product family sold into the EU, its current standard, the expected switch, the environmental data it will need and where that data sits today. It should leave the leadership team with a sequence of work and a clear view of which plants need data routines first.

Ganrich Advisory runs this as a focused review with your quality, plant and export teams, and coordinates with notified bodies and life-cycle assessment specialists where they are needed. We do not certify products or verify declarations. We share the working method in a conversation rather than in print, because it depends on the portfolio.
